

Metropolitan Water Reclamation District of Greater Chicago

Welcome to the September Edition
of the 2024 M&R Seminar Series

November 8, 2024

NOTES FOR SEMINAR ATTENDEES

- Remote attendees' audio lines have been muted to minimize background noise.
For attendees in the auditorium, please silence your phones.
- A question and answer (Q/A) session will follow the presentation.
- For remote attendees, please use “**Chat**” only to type questions for the presenter. For other issues, please email Pam to SlabyP@mwr.org.
For attendees in the auditorium, please raise your hand and wait for the microphone to ask a verbal question.
- The presentation slides will be posted on the MWRD website after the seminar.
- This seminar has been approved by the ISPE for one PDH and approved by the IEPA for one TCH. Certificates will be issued only to participants who attend the entire presentation.

Elizabeth W. Keddy, PE, LEED AP
Senior Associate, Hazen and Sawyer, Tampa, Florida

Ms. Keddy is an environmental engineer specializing in energy management, data analytics, asset management, and sustainable and resilient infrastructure. She has over 16 years of experience leading the planning, design, implementation, operation and maintenance of water, wastewater, and energy projects. She has been with Hazen and Sawyer since January 2020. Ms. Keddy is a Licensed Professional Engineer in Florida and Massachusetts and a Leadership in Energy and Environmental Design Accredited Professional (LEED AP) from the U.S. Green Building Council. She is Chair of the FWEA Utility Management Committee and Chair of the FSAWWA Region IV Technical & Education Committee. Ms. Keddy has a Bachelor's and Master's in Environmental Engineering from University of Florida.

Elizabeth Watson Keddy, PE, LEED AP

- Environmental Engineer with 16 years experience:
 - All Things Water
 - Sustainability and Resiliency
 - Energy and Asset Management
 - Utility Management (Strategic Planning, Organizational Health, Data/Digital, Funding/Finance, etc.)
- With Hazen for 4 years (Tampa and S FL)
- Energy Manager of SUEZ North America for 7 years
- 5 years in engineering consulting prior
- Go Gators

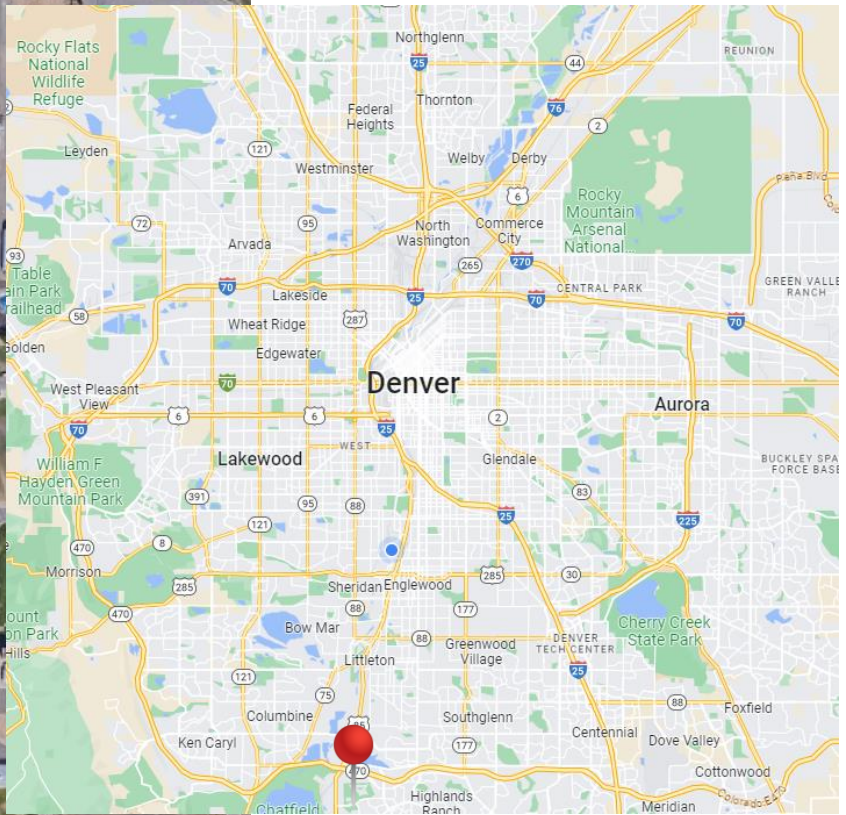

Roadmap for Achieving Energy Management Vision and Goals:

South Platte Renew Improves Energy Efficiency While Addressing Regulatory Challenges and Aging Infrastructure in Colorado

Friday, November 8, 2024, at Metropolitan Water Reclamation District of Greater Chicago (MWRDGC)

History

- 1977 – Original Construction
- 1991, 1999, 2008 – Major Updates

Size

50 MGD Permitted
18 MGD Average Flow
53 Acres

Process

- Trickling Filters/Aeration
- Digestion/RNG

Energy Usage

- ~20,000,000 kwh/year
- >\$2 million/ year

**SOUTH PLATTE
RENEW**
OWNED BY LITTLETON/ENGLEWOOD

Energy Drivers

Increasing regulatory pressure

COLORADO
Department of Public
Health & Environment

Increasing regulatory pressure

Aging Infrastructure

Energy Drivers

Increasing regulatory pressure

Aging Infrastructure

Increasing operating costs

Increasing regulatory pressure

Aging Infrastructure

Increasing operating costs

Environmental stewardship

Path to Energy Efficiency

Energy Improvement Program (EIP)

- Internal energy management group (10)
- Process control changes

Strategic Energy Management (SEM) Cohort

- Energy scan
- Workshops

2015 2016 2017 2018 2019 2020 2021 2022 2023

RNG Pipeline Injection Installation

- First installation of its kind in Colorado

EMMP Kick-off

- Engaged Hazen

Energy Management Goals

*Decrease energy use and cost
without compromising water quality*

Clear pathway

Organizational longevity

Best management practices

Energy Management Approach

A wide-angle photograph of a water treatment plant at sunset. The sky is a mix of orange, yellow, and blue. In the foreground, there are several large, teal-colored industrial pumps or turbines on a concrete platform. To the right, a large, circular building with a geodesic dome roof is visible. In the background, there are various industrial buildings and structures, including circular tanks and rectangular buildings. The overall scene is a mix of industrial and natural elements.

Program
planning

Project Approach

Workshop-based approach to develop buy-in from staff at all levels

- A workshop-based approach maintains open lines of communication and meaningful plant staff engagement:

Energy Usage Analysis Overview *Goal: Establish energy baselines for SPR's EMMP*

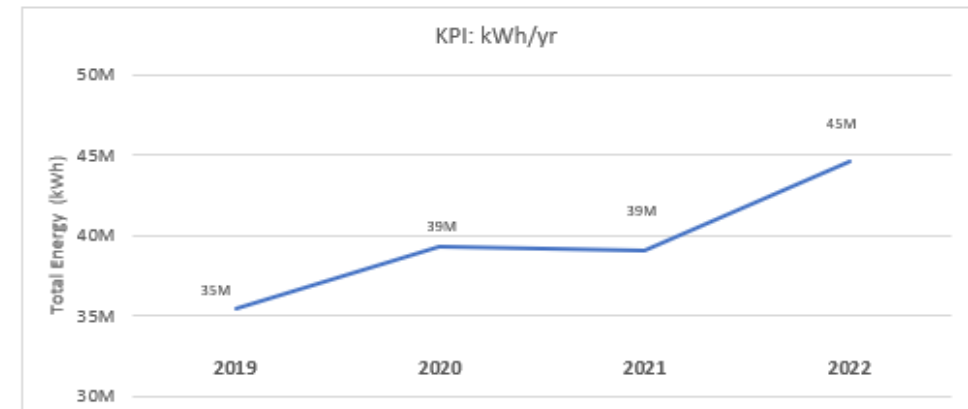

Energy Usage Analysis Tool

Data Range: 2019-May 2022

| | | | |
|--------------|--------------------|---------------------|----------------------|
| Data Summary | RW Pump Station | DAFT | 3WPS |
| Plant Flow | Screens and Grit | Digestion | Facilities Buildings |
| | Primary Clarifiers | Biogas Conditioning | Plant Distribution |
| | Trickling Filters | RNG Production | |
| | Aeration | Dewatering | |
| | Final Clarifiers | | |
| | NTF & NH3 Bypass | | |
| | Denite Filters | | |

Average Annual Energy Usage by Process Area (kWh)

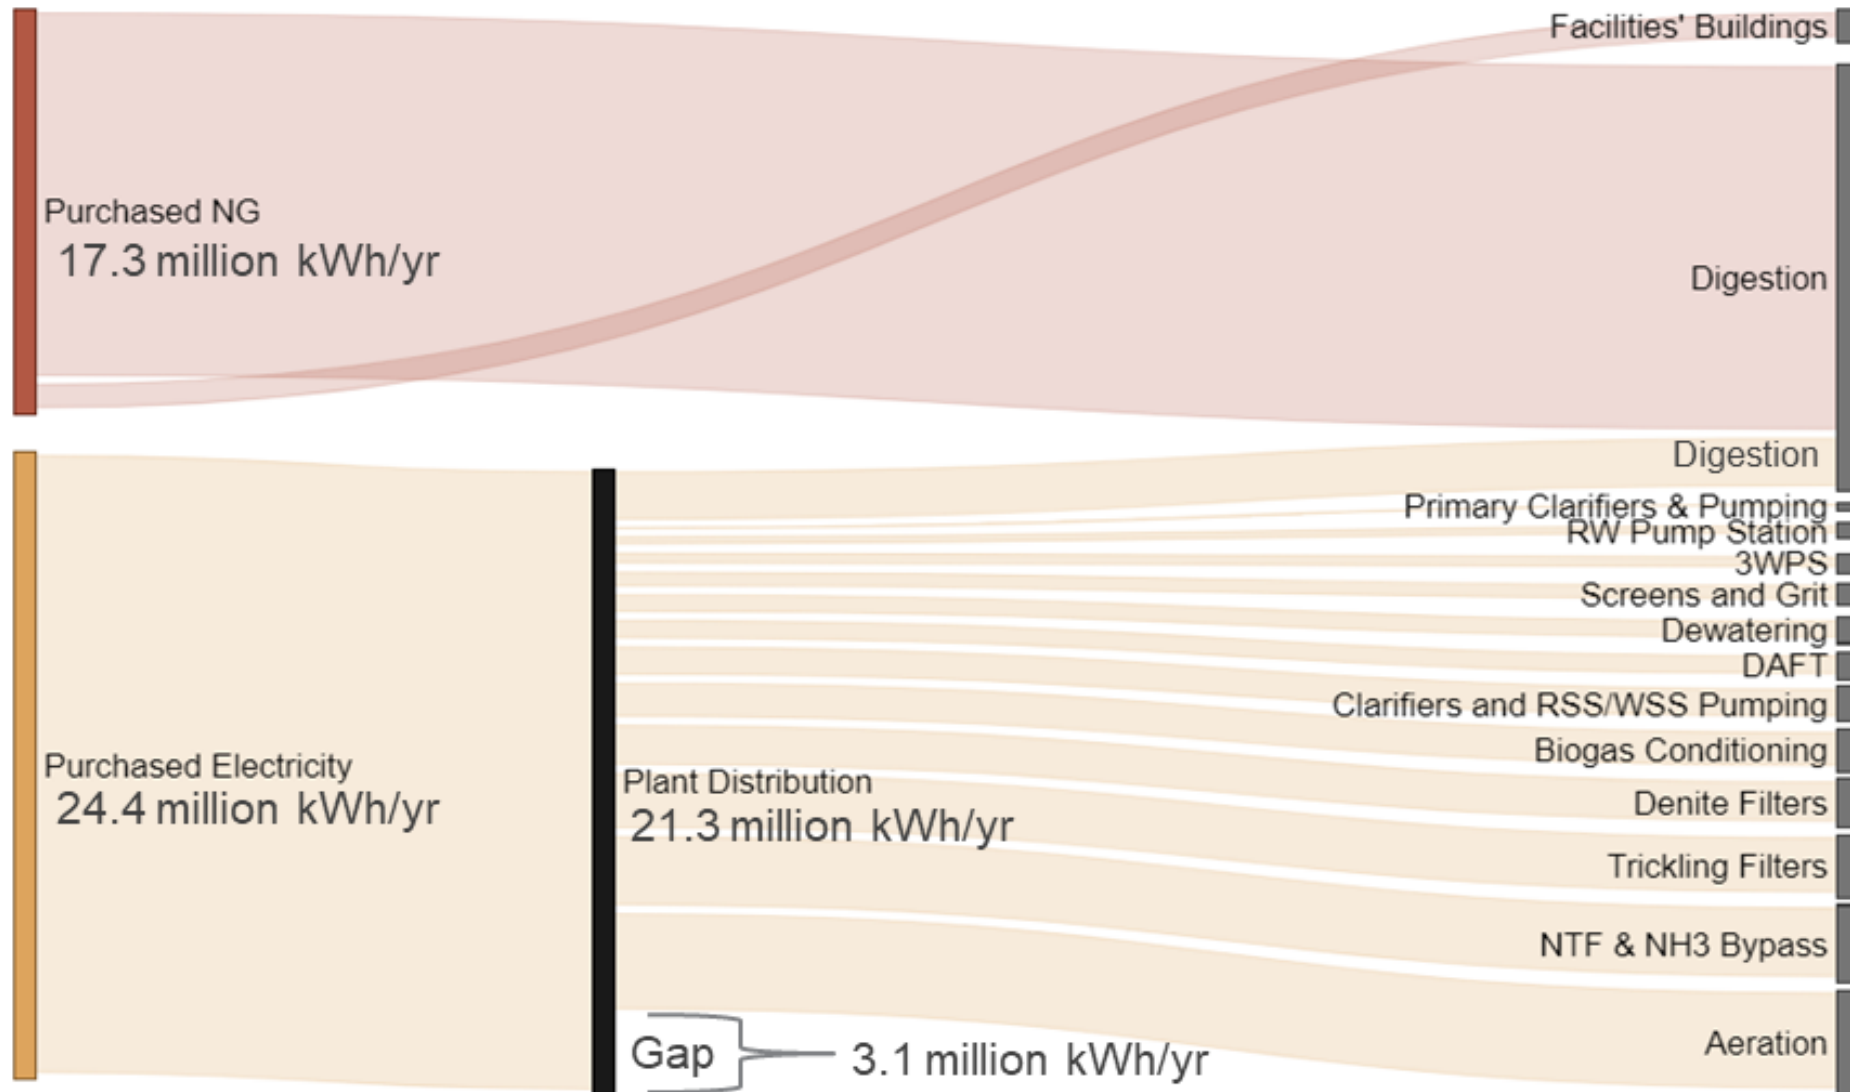

Energy Neutrality Baseline

- RNG = 55% of total energy demand (2020-2022 average)

SPR is much closer to neutrality than most wastewater utilities!

Purchased Energy Flow Schematic (Sankey Diagram)

Key Performance Indicators (KPIs) Recommended

- kWh/MG treated
- Individual equipment (pumps, blowers, etc.) efficiency (%)
- kWh per treatment process (aeration, digestion, NTFs, etc.)
- kWh/pound N removed
- Energy produced vs energy used
- Results of energy projects and operational optimization improvements completed
- Progress towards energy neutrality and energy resiliency

Average energy intensity is 3,100 to 4,700 kWh/MG

Key Findings

| Observations | Recommendations |
|--|---|
| 3.1 million Kilowatt-Hour (kWh)/year gap between SPR's existing energy monitoring and electricity purchased from Xcel | Expand SPR's energy monitoring by prioritizing actionable information and integrated implementation |
| SPR uses between 3,100 and 4,700 kWh/MG , which is ~50% higher than national benchmarks | Complete a Process Optimization Study, related energy efficiency projects and procedures to reduce kWh/MG |
| Electricity consumption does not significantly change as the plant flow varies | |
| Aeration, trickling filters, digesters, Nitrifying Trickling Filter (NTFs), and ammonia bypass pumps are the highest electric uses | |
| Digestion is the most energy-intensive process due to natural gas heating requiring 33% of total energy use | Complete a Digester Heating Demand Study and Heat Pump Evaluation to identify ways to reduce or offset natural gas (NG) |

Project Planning and Prioritization

| Prioritization Criteria | Weight |
|---|--------|
| Employee Services | 5% |
| Regulatory Requirements | 5% |
| Community Services | 10% |
| Risk & Resiliency | 15% |
| Operational Compatibility & Operability | 15% |
| Environmental Considerations | 10% |
| Impact to Energy Utilization | 10% |
| Life Cycle Benefit | 30% |

Recommended Studies and Projects

| Rank | Project Name | Cost Estimate | Score |
|------|--|-----------------------|-------|
| 1 | Energy Resiliency Evaluation | \$100,000 - \$250,000 | 57 |
| 2 | VFDs on Identified Pumps | \$90,000 | 57 |
| 3 | Heat Pump Evaluation | \$100,000 | 56 |
| 4 | VFD on Identified Fan | \$20,000 | 55 |
| 5 | Lighting and Lighting Controls Retrofits | \$70,000 | 54 |
| 6 | Biogas Production Optimization Study | \$250,000 - \$500,000 | 49 |
| 7 | Digester Heating Study | \$100,000 | 46 |
| 8 | Process Optimization Study | \$150,000 - \$250,000 | 44 |

Energy Resiliency Assessment

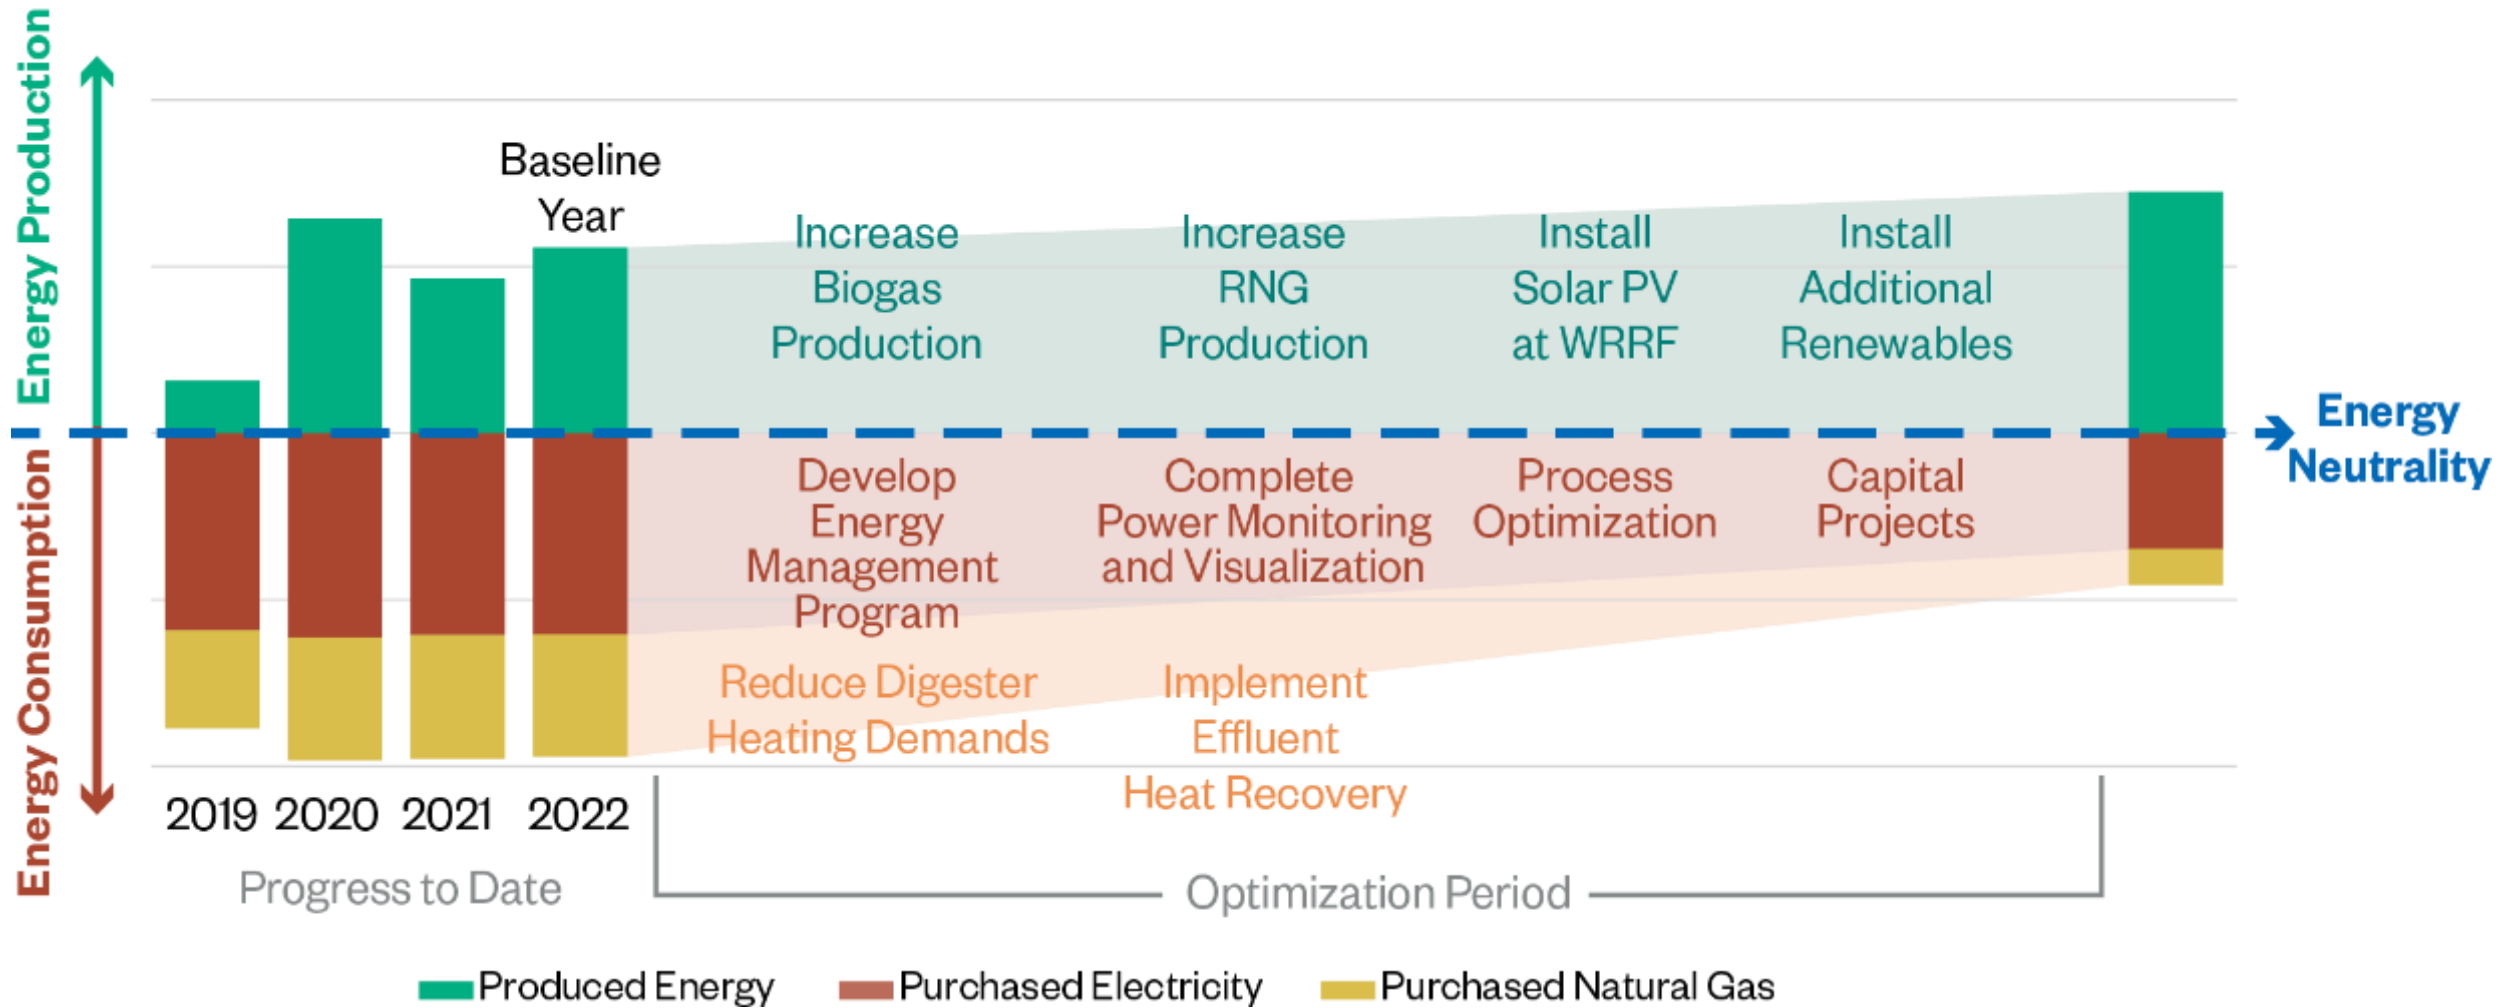

- **Capacity to respond to anticipated and unanticipated energy supply and distribution disruptions.**
- Evaluation Recommendations:
 - Normal and standby power supply.
 - Electrical redundancy and flexibility (“single point of failure”)
 - Diagnostic capabilities to facilitate timely location and cause of plant energy distribution failures.
 - Emergency preparedness and response capabilities.
 - System Documentation
 - Condition assessments

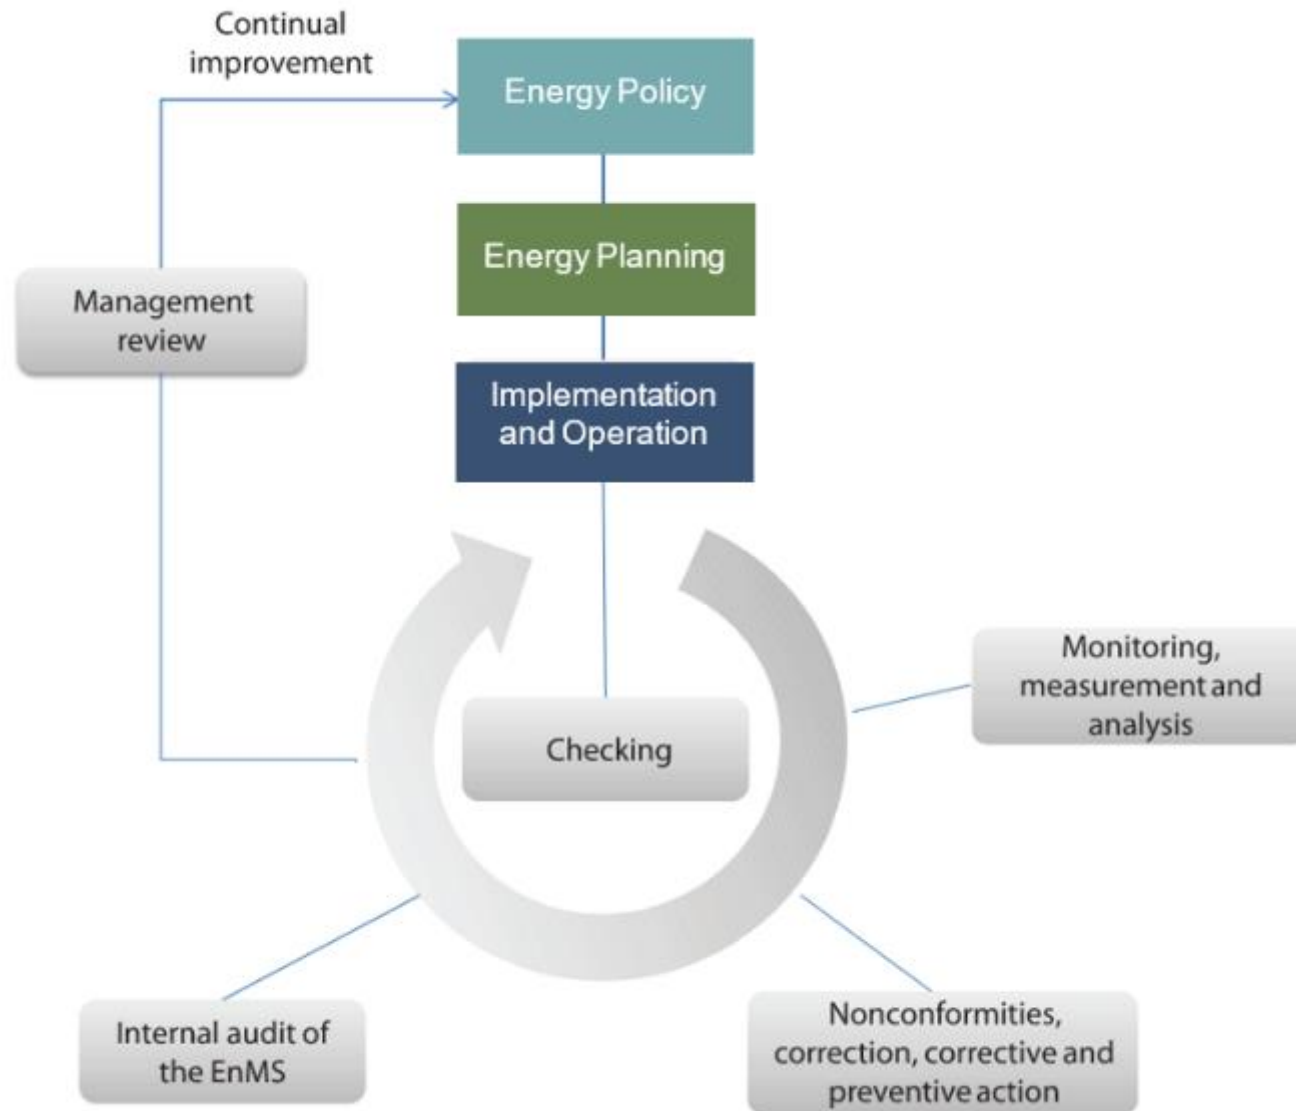

Additional Energy Projects

- **Heat Pump Evaluation:** Confirm the feasibility of using high-temperature heat pumps for effluent temperature reduction and thermal energy recovery for digester and building heating in coordination and alignment with the Digester Heating Demand Study and Biogas Production Optimization Study.
- **Biogas Production Optimization Study:** Identify opportunities to further optimize biogas and RNG production.
- **Digester Heating Study:** Investigate alternatives to reduce digester heating demands by increasing solids concentration and/or improving heat retention. If SPR moves forward with heat pump installation, it may negate the need for decreasing digester heating demand.
- **Process Optimization Study:** Identify “quick wins” that reduce energy consumption with little to no capital cost, such as improved process control strategies, and enhance process turndown capabilities, such as managing the number of online process units and expanding the use of and/or optimizing variable speed systems.

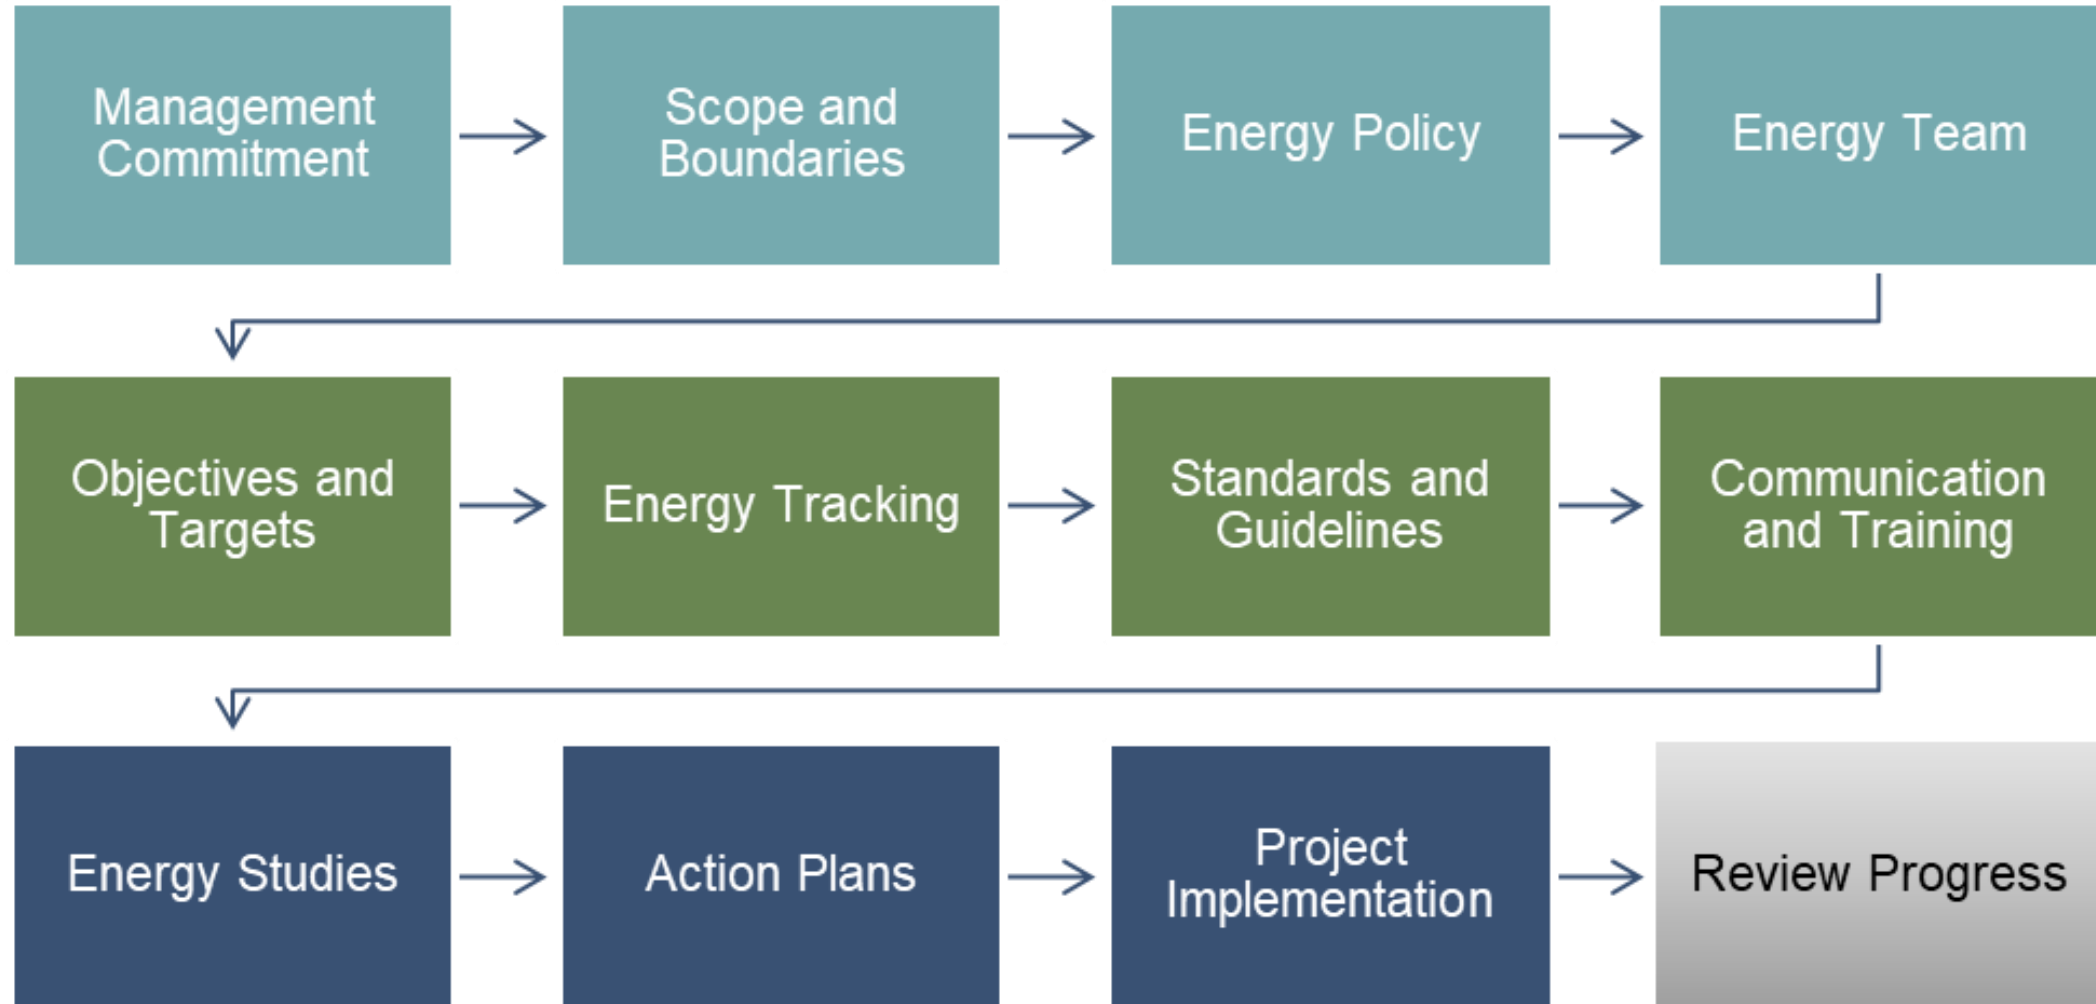

SPR's Path to Energy Neutrality

Recommended Industry Standard: ISO 50001 Energy Management Systems

Energy Policy, Planning, Implementation and Operation, and Review Workflows

Set Objectives and Targets

Task 12 in the 50001 Ready Navigator

Policy

Continually improve energy performance and reduce energy costs

Objectives

Reduce energy use

Reduce energy cost

Move towards energy neutrality

Improve energy awareness

Facilitate staff-driven optimization

Targets

kWh/pound N removed

kWh/MG treated

kWh on-peak vs off-peak

% of energy bills analyzed

Renewable energy produced/energy used

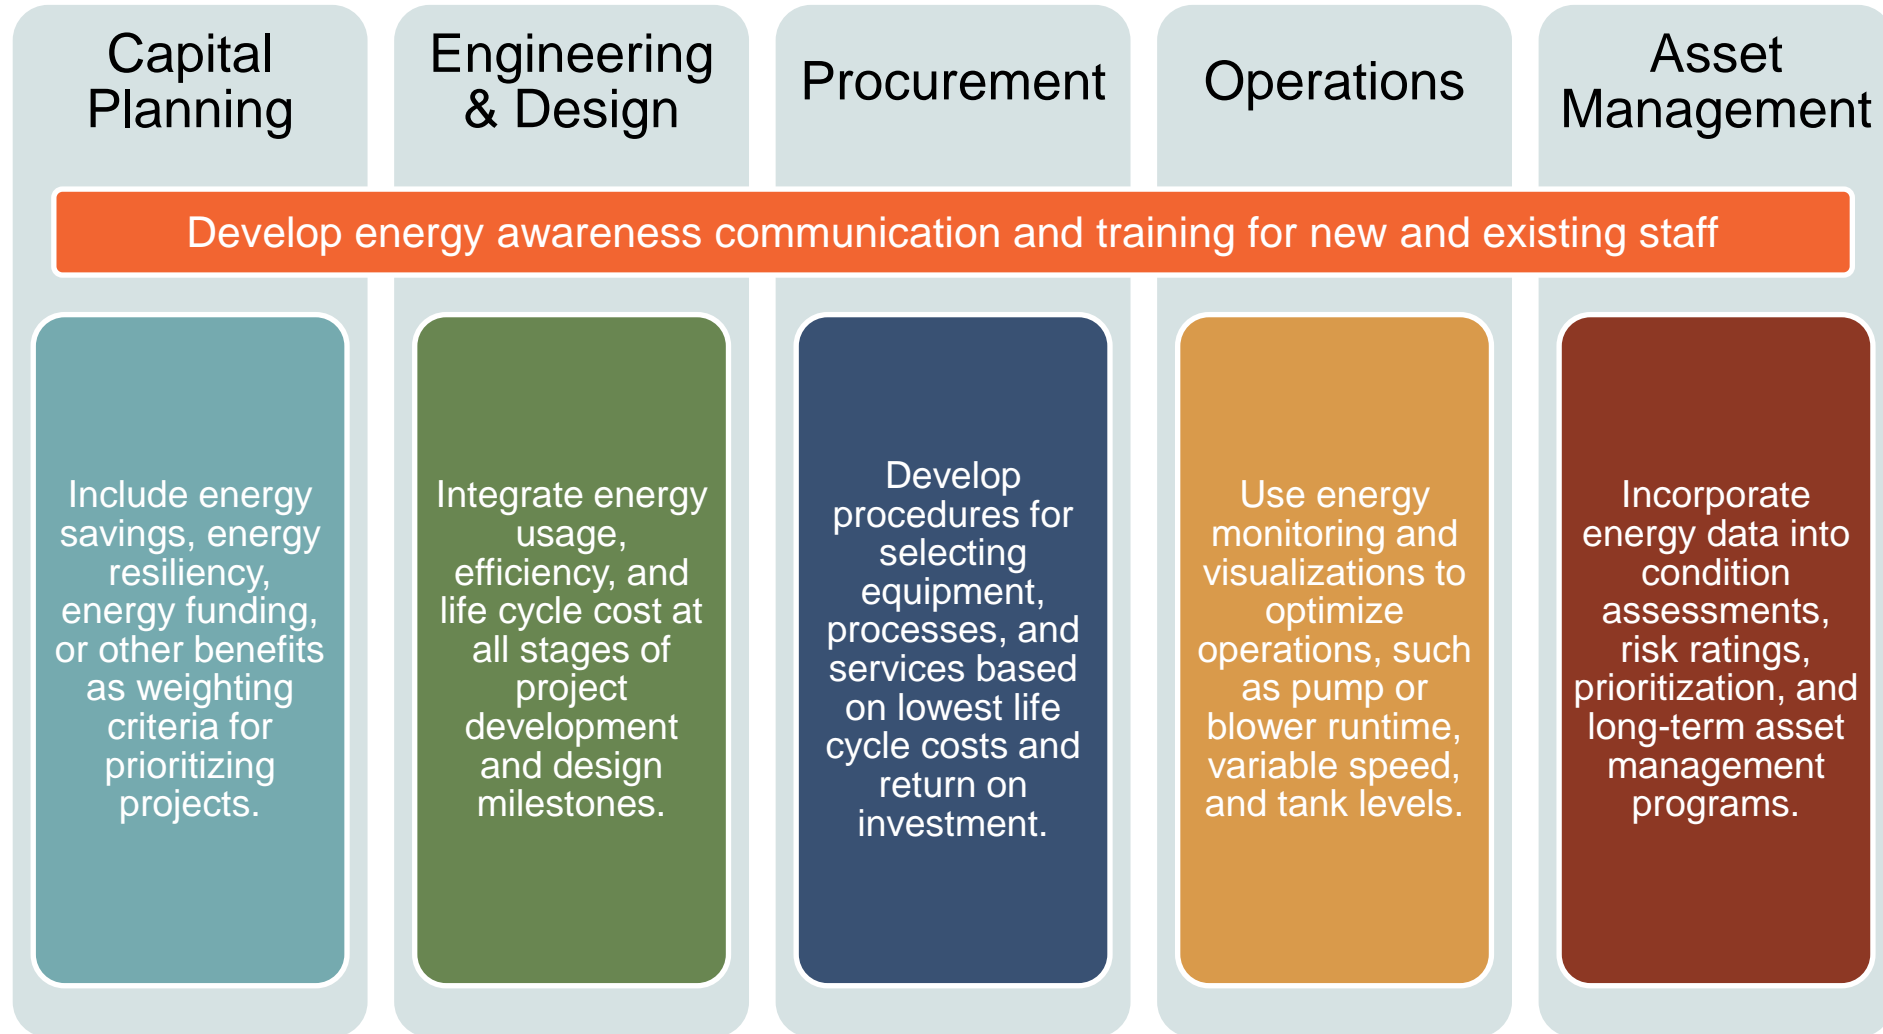

of plans and SOPs w/ energy

Employee trainings/year

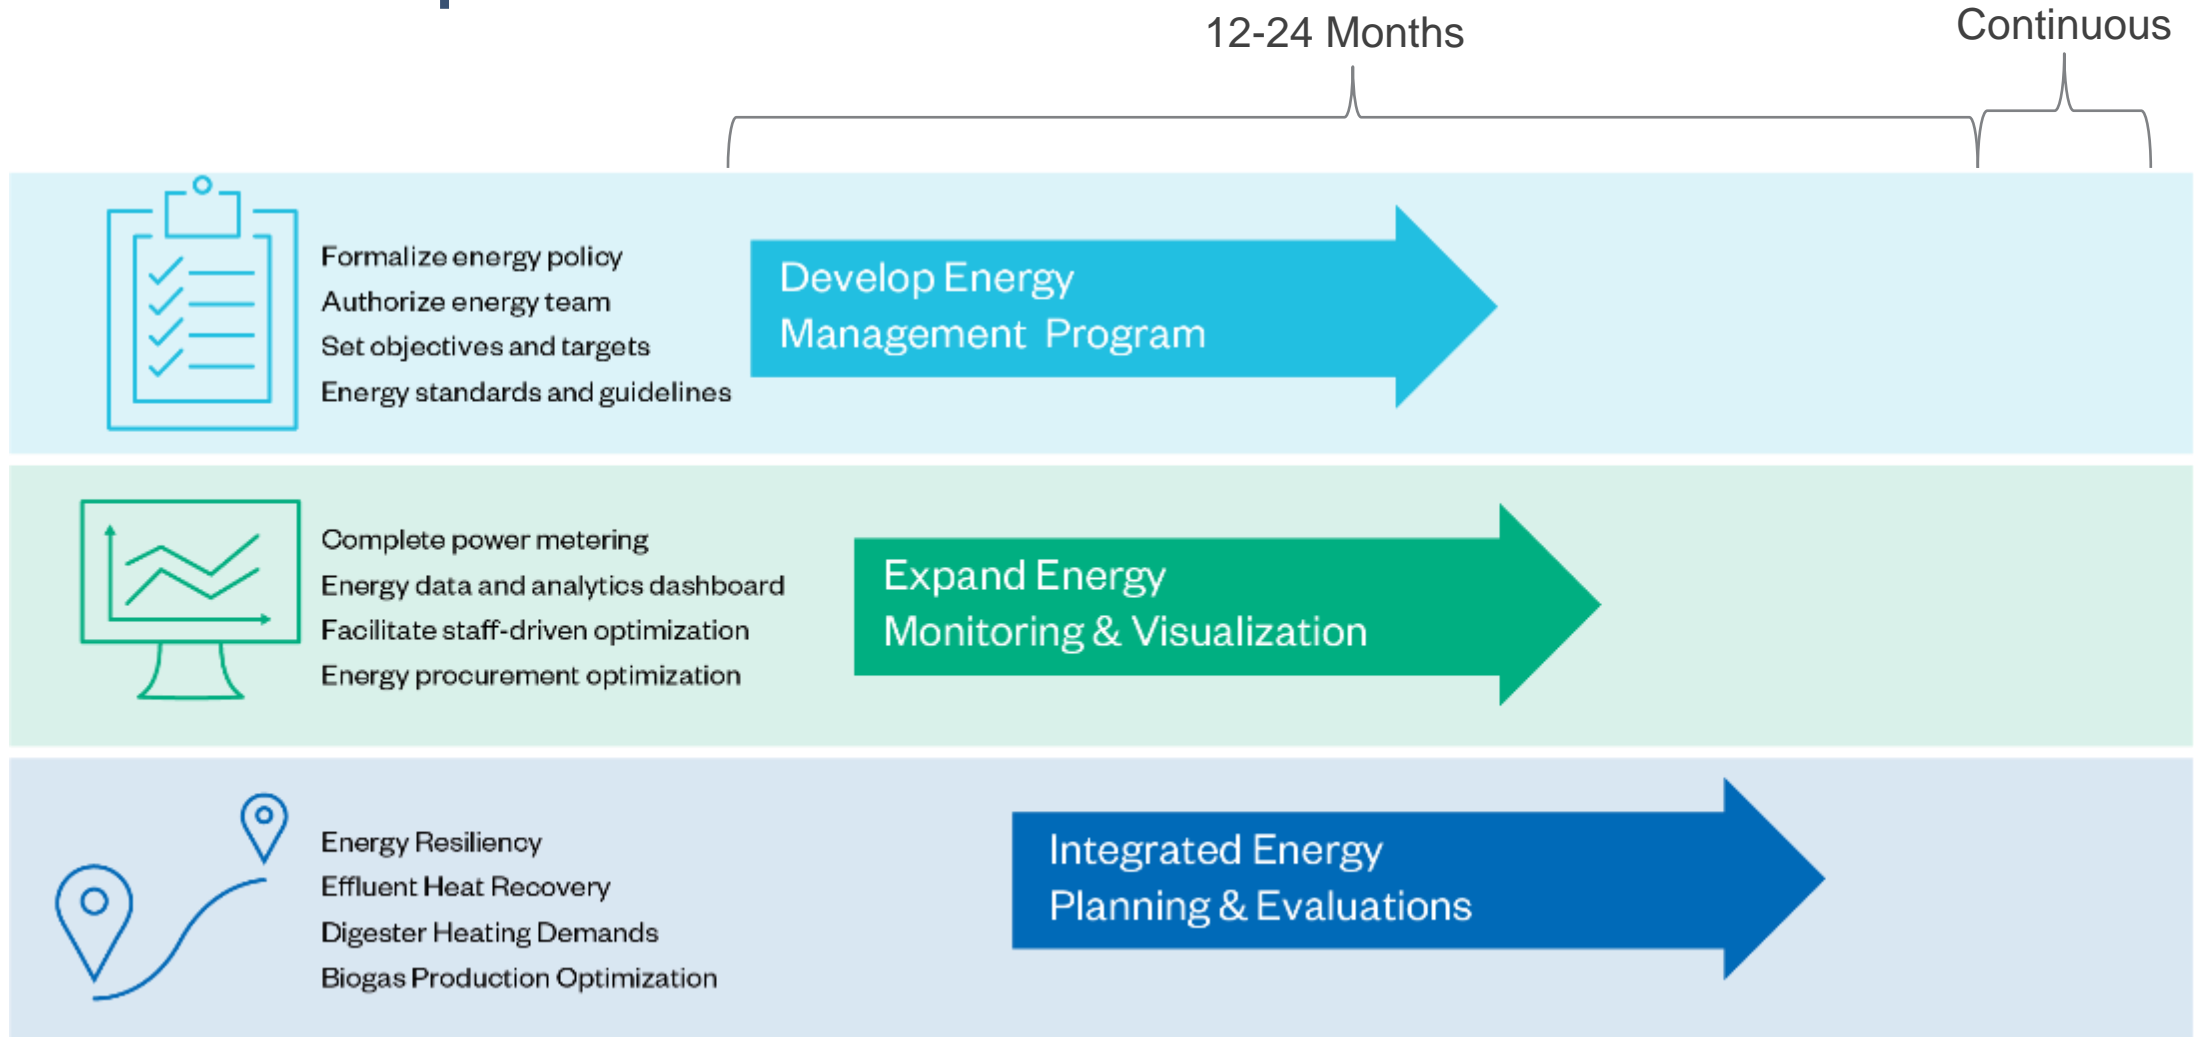

% power meters installed and used for analytics

Training, Resources and Communication
