## INTRODUCTION

The purpose of this report is to meet the reporting requirements of the Illinois Environmental Protection Agency (IEPA) relative to annual flood control utilization of the Thornton Transitional Reservoir (Reservoir) for 2010. The specific informational requirements are described in the June 16, 2001, Scope of Work (SOW) for Groundwater Quality Monitoring of the Reservoir. The SOW was approved in a letter from the IEPA dated August 6, 2001.

The reporting requirements are found in Section 7 of the SOW. The requirements for the annual flood control utilization of the Reservoir shall include:

1. The year's monitoring well sample analysis results.
2. Reservoir content grab sample results.
3. Detailed review and comparison of the monitoring well sampling analysis results, utilizing the monitoring well statistical background determinations.

### **Objective**

The objective of collecting groundwater quality data from the four monitoring wells QT-1, QT-2, QT-3, and QT-4 and Reservoir content grab samples is to assess any possible contamination of the monitoring wells which may result from seepage produced during the diversion event for any of the parameters indicated in Table 2 of the SOW (Table 1).

### **Project Description**

The Reservoir is in the West Lobe of the Thornton Quarry southeast of the intersection of the Tri-State Tollway and Halsted Street in Thornton, Illinois, as shown in Figure 1. The Reservoir is the final structural measure to be implemented for the Little Calumet River Watershed under the Natural Resources Conservation Service Little Calumet Watershed Plan of November 1998. The Reservoir provides 3.7 billion gallons (BG) of floodwater storage, which has been expanded from the planned 3.1 BG due to additional rock mining and provides sufficient volume to capture a 100-year storm event from Thorn Creek at a point just south of the Tri-State Tollway.

The project provides flood control benefits for 21 businesses and 4,400 residences, for an average benefit of \$6.8 million per year. Within the Little Calumet watershed are the communities of Blue Island, Calumet City, Dixmoor, Dolton, Glenwood, Harvey, Lansing, Phoenix, Riverdale, and South Holland, which receive flood control benefits.

The Reservoir consists of a diversion structure at Thornton Creek, a 24-foot diameter dropshaft and 22-foot diameter conveyance tunnel to the Lower West Lobe of Thornton Quarry. The project also includes an 8-foot diameter tunnel connected to the Calumet Tunnel and Reservoir Plan System that will be utilized for Reservoir dewatering purposes only.

## **FIELD SAMPLING**

There were three diversion events at the Reservoir during the year 2010, June 24–25, 2010, August 3–5, 2010, and December 31, 2010–January 1, 2011. The diversion events of 2010 are summarized in Table 2.

During these events, in accordance with the SOW, samples were collected from the four groundwater quality monitoring wells surrounding the Reservoir and grab samples were taken from the Reservoir, except for those instances when sampling equipment was malfunctioning or access to the sampling locations was impossible due to natural causes. The parameters to be analyzed for are found in Table 1, which presents all the parameters listed in Table 2 of the SOW.

## **ANALYTICAL DATA RESULTS**

Tables 3 through 10 contain the results of the analyses of the four groundwater quality monitoring wells surrounding the Reservoir along with the calculated upper 95 percent confidence limits for the June 24–25, 2010, diversion event. The calculated upper 95 percent confidence limits were derived using ten samples from background monitoring between October 2002 and September 2004. These limits were updated from those using six samples collected from October 2002 and May 2003 which were reported in the Reservoir Pre-Operational Background Groundwater Quality Report (Research and Development Department Report No. 03-23). Tables 11 and 12 contain the results of the grab samples from the Reservoir for the June 24–25, 2010, diversion event. Tables 13 through 18 contain the results of the analyses of the four groundwater quality monitoring wells surrounding the Reservoir along with the calculated upper 95 percent confidence limits for the August 3–5, 2010, diversion event. Tables 19 and 20 contain the results of the grab samples from the Reservoir for the August 3–5, 2010, diversion event. Tables 21 through 28 contain the results of the analyses of the four groundwater quality monitoring wells surrounding the Reservoir along with the calculated upper 95 percent confidence limits for the December 31, 2010–January 1, 2011, diversion event. Tables 29 and 30 contain the results of the grab samples from the Reservoir for the December 31, 2010–January 1, 2011, diversion events.

## DISCUSSION OF RESULTS

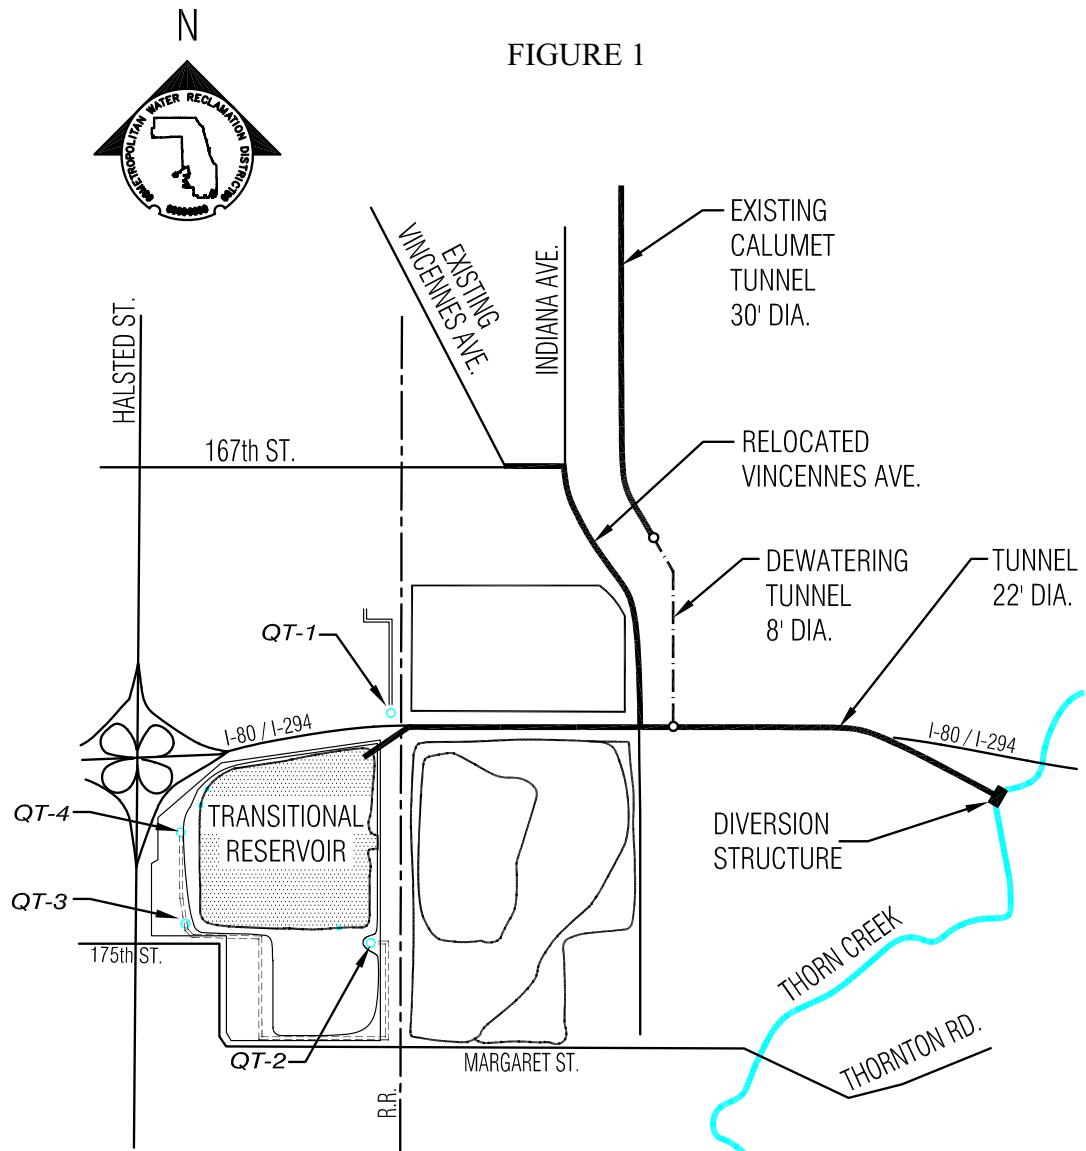

During all three diversion events samples of both the surrounding groundwater quality monitoring wells and the Reservoir itself were collected as long as there was water in the Reservoir per requirements of the SOW.

During the June 24–25, 2010, diversion event, the upper confidence limit from the background sampling was exceeded for the following parameters: QT-1 (Tables 3 and 4) chloride and manganese; no excursions were observed for QT-2 (Tables 5 and 6); QT-3 (Tables 7 and 8) chloride and sulfate; QT-4 (Tables 9 and 10) sulfate. The Reservoir was dewatered before July 6, 2010. The last sampling event took place on July 8, 2010. QT-1 could not be sampled on July 8, 2010, because construction in the area blocked access to the well. Although the number of parameters that exceeded the corresponding 95 percent upper confidence limit decreased, there were still some parameters that exceeded the 95 percent upper confidence limit from the background sampling after the Reservoir was dewatered. These parameters were chloride and sulfate from QT-3. It should be noted that the concentrations of all parameters in the reservoir sample were well below the 95th percentile upper confidence limit established for them in Table 2 of the SOW.

During the August 3–5, 2010, diversion event, the upper confidence limit from the background sampling was exceeded for the following parameters: QT-2 (Tables 13 and 14) iron, chromium and manganese; QT-3 (Tables 15 and 16) chloride, sulfate, total dissolved solids, chromium, cyanide, and manganese; QT-4 (Tables 17 and 18) cyanide. Groundwater quality monitoring well QT-1 could not be sampled during this event because construction in the area blocked access to the well. The Reservoir was dewatered before August 26, 2010. A last set of samples were collected from the groundwater quality monitoring wells on August 26, 2010. Although the number of parameters that exceeded the corresponding 95 percent upper confidence limit decreased, there were still some parameters that exceeded the 95 percent upper confidence limit from the background sampling after the Reservoir was dewatered. These parameters were chromium from QT-2, and chloride, sulfate, total dissolved solids, and manganese from QT-3. It should be noted that the concentrations of these parameters in the reservoir samples were well below the 95th percentile upper confidence limit established in Table 2 of the SOW.

During the December 31, 2010–January 1, 2011, diversion event, the upper 95 percent confidence limit was exceeded for the following parameters: QT-1 (Tables 21 and 22) chloride and manganese; QT-2 (Tables 23 and 24) silver; QT-3 (Tables 25 and 26) chloride and sulfate; no excursions were observed for QT-4 (Tables 27 and 28) during the fill. The Reservoir was dewatered by January 19, 2011. A last set of samples was collected on January 20, 2011, one day after the Reservoir was observed to have been dewatered. Although the number of parameters that exceeded the corresponding 95 percent upper confidence limit decreased, there were still some parameters that exceeded the 95 percent upper confidence limit from the background sampling after the Reservoir was dewatered. These parameters were chloride from QT-1, silver from QT-2, chloride and sulfate from QT-3, and silver from QT-4. It should be noted that the concentrations of these parameters in the reservoir samples were well below the 95th percentile upper confidence limit established in Table 2 of the SOW.

\*\* Excursion of 95% confidence limit was calculated based on appropriate reporting limit.

TABLE 27: PARAMETERS FROM COLUMN A OF TABLE 1 FOR WATER QUALITY WELL QT-4 DURING THE DECEMBER 31, 2010–JANUARY 1, 2011, DIVERSION EVENT

Date	Arsenic (mg/L)	Boron (mg/L)	Chloride (mg/L)	Copper (mg/L)	Fecal Coliform (cts/100 mL)	Iron (mg/L)	Lead (mg/L)	Mercury (µg/L)	Phenols (µg/L)	Sulfate (mg/L)	Total Dissolved Solids (mg/L)	Ammonia Nitrogen (mg/L)
1/7/11	ND	0.415	344	ND	<1	6.09	ND	ND	6	268	1,336	0.47
1/13/11	ND	0.351	404	ND	<1	0.77	ND	ND	ND	146	1,362	0.42
1/20/11	ND	0.408	447	ND	<1	0.71	ND	ND	5	267	1,412	0.45
Limit of Quantification	0.050	0.06	10	0.020	DL	0.10	0.030	0.20	5	3	60	0.10
Upper 95% Confidence Limit	*	NA	611	0.073	NA	31.510	*	*	NA	300	1,873	NA
Excursion During Fill	No**		No	No		No	No**	No**		No	No	
Excursion After Fill	No**		No	No		No	No**	No**		No	No	

NA = Not applicable.

ND = Not detected.

DL = The detection limit for the FC analysis using the membrane filter method varies with actual sampling volume analyzed.

\*Values below reporting limit.

\*\* Excursion of 95% confidence limit was calculated based on appropriate reporting limit.

TABLE 28: PARAMETERS FROM COLUMN B OF TABLE 1 FOR WATER QUALITY WELL QT-4 DURING THE DECEMBER 31, 2010–JANUARY 1, 2011, DIVERSION EVENT

Date	Barium	Cadmium	Chromium	Cyanide	Fluoride	Manganese	Nickel	Silver	Temperature	Nitrate	Nitrogen	BOD <sub>5</sub>	BOD <sub>21</sub>
