1	Thornton Transitional Reservoir Monitoring Well Locations	5

INTRODUCTION

The purpose of this report is to meet the reporting requirements of the Illinois Environmental Protection Agency (IEPA) relative to annual flood control utilization of the Thornton Transitional Reservoir (Reservoir) for 2011. The specific informational requirements are described in the June 16, 2001, Scope of Work (SOW) for Groundwater Quality Monitoring of the Reservoir. The SOW was approved in a letter from the IEPA dated August 6, 2001.

The reporting requirements are found in Section 7 of the SOW and modified in a letter to the IEPA dated May 9, 2005. The requirements for the annual flood control utilization of the Reservoir shall include:

1. The year's monitoring well sample analysis results.
2. Reservoir content grab sample results.
3. Detailed review and comparison of the monitoring well sampling analysis results, utilizing the monitoring well statistical background determinations.

Objective

The objective of collecting groundwater quality data from the four monitoring wells QT-1, QT-2, QT-3, and QT-4 and Reservoir content grab samples is to assess any possible contamination of the monitoring wells which may result from seepage produced during a diversion event for any of the parameters indicated in Table 2 of the SOW (Table 1). Twenty-one-day biochemical oxygen demand analysis was discontinued on June 29, 2011, based on a memorandum sent to the IEPA on August 9, 2010 (Appendix A1).

Project Description

The Reservoir is in the West Lobe of the Thornton Quarry southeast of the intersection of the Tri-State Tollway and Halsted Street in Thornton, Illinois, as shown in Figure 1. The Reservoir is the final structural measure to be implemented for the Little Calumet River Watershed under the Natural Resources Conservation Service Little Calumet Watershed Plan of November 1998. The Reservoir provides 3.7 billion gallons (BG) of floodwater storage, which has been expanded from the planned 3.1 BG due to additional rock mining and provides sufficient volume to capture a 100-year storm event from Thorn Creek at a point just south of the Tri-State Tollway.

The project provides flood control benefits for 21 businesses and 4,400 residences, for an average benefit of \$6.8 million per year. Within the Little Calumet watershed are the Illinois communities of Blue Island, Calumet City, Dixmoor, Dolton, Glenwood, Harvey, Lansing, Phoenix, Riverdale, and South Holland, which receive flood control benefits.

The Reservoir consists of a diversion structure at Thorn Creek, a 24-foot diameter dropshaft and 22-foot diameter conveyance tunnel to the Lower West Lobe of Thornton Quarry. The project also includes an 8-foot diameter tunnel connected to the Calumet Tunnel and Reservoir Plan System that will be utilized for Reservoir dewatering purposes only.

FIELD SAMPLING

There were five diversion events at the Reservoir during the year 2011, April 22–23, 2011, April 26–28, 2011, May 26–27, 2011, May 29–30, 2011, and June 9–11, 2011. The volume collected, date of complete drainage, and number of weeks sampled for each diversion event of 2011 are summarized in Table 2.

During these events, in accordance with the SOW, groundwater samples were collected from the four monitoring wells surrounding the Reservoir, and grab samples were taken from the Reservoir. The parameters analyzed for in each monitoring well and Reservoir sample are found in Table 1.

ANALYTICAL DATA RESULTS

Tables 3 through 10 contain the results of the analyses of the four monitoring wells surrounding the Reservoir for the April 22–23, 2011, and April 26–28, 2011, diversion events. The upper 95 percent confidence limit for each analyte is also provided for comparison in these tables. The calculated upper 95 percent confidence limits were derived using ten samples from background monitoring between October 2002 and September 2004. These limits were updated from those using six samples collected from October 2002 and May 2003 which were reported in the Reservoir Pre-Operational Background Groundwater Quality Report (Research and Development Department Report No. 03-23). Tables 11 and 12 contain the results of the grab samples from the Reservoir for the April 22–23, 2011, and April 26–28, 2011, diversion events. Tables 13 through 20 contain the results of the analyses of the four monitoring wells surrounding the Reservoir as well as the calculated upper 95 percent confidence limits for the May 26–27, 2011, May 29–30, 2011, and June 9–11, 2011, diversion events. Tables 21 and 22 contain the results of the grab samples from the Reservoir for the May 26–27, 2011, May 29–30, 2011, and June 9–11, 2011, diversion events.

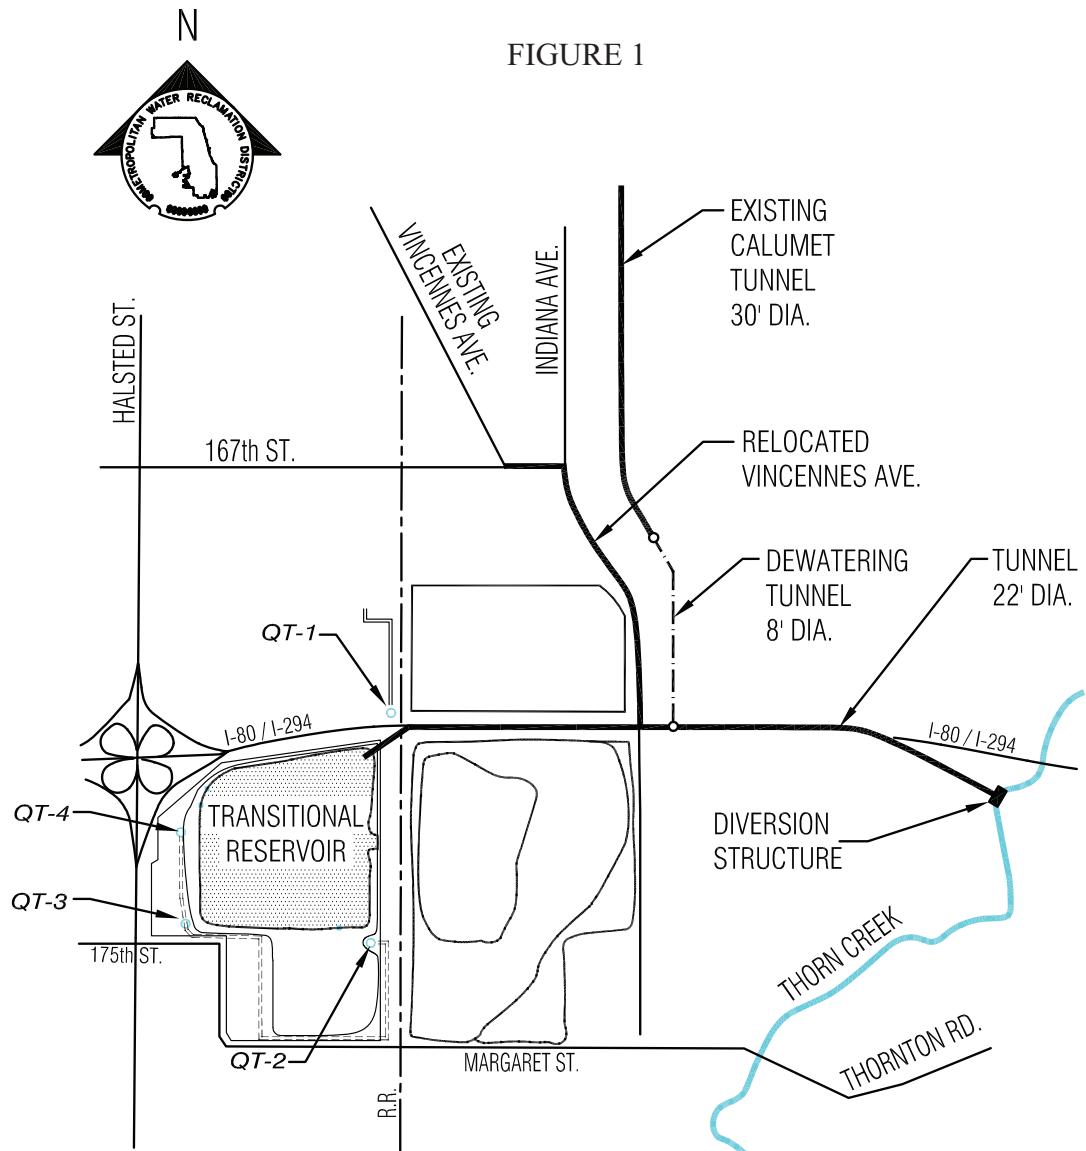

DISCUSSION OF RESULTS

During all diversion events, samples of both the surrounding monitoring wells and the Reservoir itself were collected as long as there was water in the Reservoir per requirements of the SOW.

During the April 22–23, 2011, and April 26–28, 2011, diversion events, the 95 percent upper confidence limit from the background sampling was exceeded for the following parameters: QT-1 ([Tables 3 and 4](#)) chloride and silver; QT-2 ([Tables 5 and 6](#)) silver; QT-3 ([Tables 7 and 8](#)) chloride and sulfate, and QT-4 ([Tables 9 and 10](#)) silver. The Reservoir was dewatered by May 5, 2011, and the last sampling event took place on May 5, 2011. Although the number of parameters that exceeded the corresponding 95 percent upper confidence limit decreased, there were still some parameters that exceeded the upper 95 percent confidence limit from the background sampling after the Reservoir was dewatered. These parameters were chloride and silver from QT-1 and chloride, sulfate, and total dissolved solids from QT-3. Total dissolved solids could not be analyzed on May 5, 2011, for QT-1 and QT-4, because there was insufficient sample volume for analysis. It should be noted that the concentrations of these parameters in water samples from the Thornton Reservoir were below the upper 95th percentile confidence limits established for the surrounding groundwater.

During the May 26–27, 2011, May 29–30, 2011, and June 9–11, 2011, diversion events, the 95 percent upper confidence limit from the background sampling was exceeded for the following parameters: QT-1 ([Tables 13 and 14](#)) chloride, total dissolved solids, cadmium, manganese, silver, and nitrate nitrogen; QT-2 ([Tables 15 and 16](#)) iron, cyanide, and manganese; QT-3 ([Tables 17 and 18](#)) chloride, iron, sulfate, total dissolved solids, and manganese; QT-4 ([Tables 19 and 20](#)) iron, total dissolved solids, and manganese. It should be noted that the concentrations of these parameters in water samples from the Thornton Reservoir were below the upper 95th percentile confidence limits established for the surrounding groundwater. The Reservoir was dewatered by August 30, 2011. A last set of samples were collected from the monitoring wells on August 25, 2011, five days before the Reservoir was observed to have been dewatered. On June 9, 2011, and June 16, 2011, muddy conditions blocked access to monitoring well QT-4 and as a result samples could not be collected for these two dates. Total dissolved solids could not be analyzed on June 2, 2011, for monitoring wells QT-1 and QT-4, because there was insufficient sample volume from both monitoring wells for analysis. Five-day biochemical oxygen demand could not be analyzed on July 28, 2011, for monitoring well QT-1, because a sample was not submitted to the laboratory.

Mr. Sanjay Sofat

Division of Water Pollution Control

Bureau of Water

Illinois Environmental Protection Agency

P.O. Box 19276

Springfield, IL 62794-9276

Dear Mr. Sofat,

Subject: Request for Exemption of 21-Day Biochemical Oxygen Demand Analysis for the Groundwater Monitoring Wells and the Diversions to the Thornton Transitional Flood Control Reservoir

The Scope of Work (SOW) for the Thornton Transitional Flood Control Reservoir (Reservoir) Groundwater Monitoring Program issued by the Illinois Environmental Protection Agency on June 26, 2001 requires the Metropolitan Water Reclamation District of Greater Chicago (District) to analyze five-day biochemical oxygen demand (BOD_5) and 21-day biochemical oxygen demand (BOD_{21}) for the samples collected from the four groundwater monitoring wells (QT-1 through QT-4) and the Reservoir. From 2004 to 2009, a total of 70 or more samples have been collected from each of the four groundwater monitoring wells and the Reservoir for BOD_5 and BOD_{21} analyses. The analytical results for BOD_5 and BOD_{21} from 2004 to 2009 are presented in Tables 1 and 2 for the four groundwater monitoring wells and the Reservoir, respectively. The method detection limit (MDL) for both BOD_5 and BOD_{21} analyses is 2 mg/L. Any value less than the MDL was reported as <2 mg/L in the tables.

Statistical analyses were conducted for both BOD_5 and BOD_{21} for each of the four groundwater monitoring wells and the Reservoir. For the purpose of calculation, the MDL value of 2 mg/L was assigned to any value reported as <2 mg/L. Complete data is used for basic statistics, such as arithmetic averages and standard deviations, and Analysis of Variance (ANOVA). Paired data, i.e. both BOD_5 and BOD_{21} are present, was used for the regression analysis. The results of the statistical analyses are presented in Tables 3 and 4.

Complete ANOVA results are shown in Table 3, which shows the population variances (σ_1^2, σ_2^2) for BOD_5 and BOD_{21} are equivalent. These results also indicate that at 5 percent level of significance there are statistically significant differences between the average BOD_5 and BOD_{21}

Subject: Request for Exemption of 21-Day Biochemical Oxygen Demand Analysis for the Groundwater Monitoring Wells and the Diversions to the Thornton Transitional Flood Control Reservoir

values (μ_1 , μ_2) for the groundwater monitoring wells and the Reservoir except for monitoring well QT-2.

The results of a regression analysis are presented in Table 4. The results show that at each monitoring site BOD_{21} has a very close non-linear relationship in the form of BOD_5 power and the R^2 of fit between BOD_{21} and BOD_5 for the relationships is all greater than 0.87 indicating that BOD_5 can be a good predictor of the BOD_{21} for each of the monitoring sites. Judging from the data presented in Table 4, the District could safely eliminate future monitoring of BOD_{21} without compromising the quality of monitoring.

Given that a BOD_5 value can be a good predictor of BOD_{21} value, little information will be lost and the extra time and expense to the taxpayer can be saved by not analyzing for BOD_{21} . Therefore, the District is requesting an exemption from the BOD_{21} analysis for the four groundwater monitoring wells and the Reservoir for the Thornton Transition Reservoir.

We will assume your approval of this request and will stop analyzing BOD_{21} for the groundwater monitoring wells and the reservoir in 2011, if we do not hear from you regarding this request by December 31, 2010. Please contact Heng Zhang of my staff at 708-588-4068 if you have any question with respect to information presented in this request.

Very truly yours,

11/5/09	<2	2	<2	2	<2	3	<2	2
11/12/09	<2	3	<2	2	<2	3	<2	3

¹The Method Detection Limit (MDL) value for both BOD₅ and BOD₂₁ is 2 mg/L. All values less than 2 mg/L have been reported as <2 mg/L.

²Data was missing or well could not be sampled because not enough sample volume could be collected .

10/23/07	<2	9	11/10/09	3	6

¹The Method Detection Limit (MDL) value for both BOD₅ and BOD₂₁ is 2 mg/L. All values less than 2 mg/L are reported as <2 mg/L.

²The analysis was not performed due to various reasons.

TABLE 3: BASIC STATISTICS FOR FIVE-DAY BIOCHEMICAL OXYGEN DEMAND
 AND 21-DAY BIOCHEMICAL OXYGEN DEMAND
 SIGNIFICANCE TEST ON THE AVERAGES OF 5-DAY BIOCHEMICAL OXYGEN
 DEMAND AND 21-DAY BIOCHEMICAL OXYGEN DEMAND

Sampling Point	Observations		Average		Standard Deviation		Significance Prob ¹	
	BOD ₅	BOD ₂₁	BOD ₅	BOD ₂₁	BOD ₅	BOD ₂₁	Testing Hypothesis	Hypothesis
DT-1	78	78	2.385	2.821	1.219	1.256	0.397	0.028
DT-2	72	72	2.236	2.542	1.193	1.061	0.311	0.104
DT-3	73	74	2.192	2.878	0.828	0.859	0.378	0.000
DT-4	72	73	2.250	2.849	1.371	1.023	0.109	0.003
Reservoir	68	68	4.441	6.162	3.504	2.778	0.172	0.002

¹Significance Probability <0.05 indicates that the hypothesis is rejected.

TABLE 4: BASIC STATISTICS FOR FIVE-DAY BIOCHEMICAL OXYGEN DEMAND AND 21-DAY BIOCHEMICAL OXYGEN DEMAND REGRESSION ANALYSIS AND TEST ON REGRESSION COEFFICIENTS

Sampling Point	Relationship	Regression R ²	Coefficient (b)	Variance b	Stat (T)	Sig Prob ¹ H ₀ : B=1
DT-1	BOD ₂₁ = BOD ₅ ^{1.1373}	0.911	1.1373	0.00169	81.08	0.000
DT-2	BOD ₂₁ = BOD ₅ ^{1.0721}	0.878	1.0721	0.00229	31.50	0.000
DT-3	BOD ₂₁ = BOD ₅ ^{1.2924}	0.924	1.2924	0.00194	150.96	0.000
DT-4	BOD ₂₁ = BOD ₅ ^{1.2289}	0.878	1.2289	0.00300	76.25	0.000
Reservoir	BOD ₂₁ = BOD ₅ ^{1.2095}	0.877	1.2095	0.00316	66.30	0.000

¹Significance Probability <0.05 indicates that the hypothesis is rejected.
